Notes for Phonebook Application

- Make sure the running environment is Windows. If running on linux, make sure to change the \ to / in all the files that search for the path.
- Make sure the "myTinyMVC" folder is under "localhost" when the application runs.
- The page will stay on home page http://localhost/myTinyMVC/index.php since AJAX is used through the application.
- All the set-up files and generic class files are in Lib folder; meanwhile, App folder contains all the detailed application files.
- In PhoneBook.js, when the request is sent to the url, ex.http://localhost/myTinyMVC/index.php/PhoneBook/search; the program cuts off "PhoneBook/search" and finds controller "PhoneBook" to call its function "search".
- The phonebook can add new contact, update contact, delete contact, search contact, and re-order fields "First", "Last", and "Phone number" by clicking on the table heads.
- Each person can own multiple phone numbers and share the same number with other contacts; also, each number can have multiple owners and share owners with other numbers. In other words, people and phone numbers have many-to-many relation.
